Disclaimer

This profile arises from self-report questionnaires which may have alterations/variation due to individual's actual level of motivation, interests, experience, values, abilities, skills, mood state etc. than the analysis in the report captured basis the responses shared at the time of testing. The report must be interpreted in the light of corroborating evidence gained during the clinical interview. The findings of this report should be professionally interpreted in the light of other information about the individual. This report may include sensitive information that is likely to be misinterpreted by those without the required training. Authorization for use of this report is limited to the examinee and their designated consultants. Any further use requires the authorization of the examinee or their legal guardian.

Introduction

This report is based on the subject's responses to the Rotter's Locus of Control Scale. It provides the respondent's composite score and its description.

Overview of the test

Rotter's Locus of Control was developed by Dr. Anand Kumar and Dr. S.N. Srivastava. The scale measures individual differences in the extent to which reinforcement is viewed as a consequence of one's own behavior or a consequence of forces, such as, chance, fate, or powerful others. It consists of 29 pairs of statements. The maximum possible score on Rotter's Locus of Control Scale is 23 and minimum is 0. The scale has good discriminant validity.

SAMPLE

Locus of control was developed from social learning theory which describes the degree to which an individual believes that reinforcement are contingent upon his/her own behaviour. There are two types of locus of control; internal and external. Internal locus of control refers to individuals who believe that reinforcements are contingent upon their behaviour, capacities or attributes. External locus of control refers to individuals who believe that reinforcements are not under their personal control but rather are under the control of powerful others, luck, chance, fate, etc. Thus depending on the past reinforcement experiences, a person will develop a consistent attitude tending towards either an internal or external locus as the source of reinforcement.

Total Score Interpretation

Overall_External Locus of Control

The respondent has obtained a score which corresponds to external locus of control. The individual has the perception of positive and/or negative events as being unrelated to their own behaviour in certain situations and thereby beyond personal control. Individual believes that outcomes are under the control of powerful others, luck, chance, fate, etc. Individual believes that their life is ruled by factors beyond their control.
